

CLUTCH TRANSFER DEVICE

Abstract

A transfer device for use with a dental articulator which includes a plate member and a base member spaced apart from the plate member. The base member is
5 adapted to be received by an articulator. A stem is connected to the plate member and extends between the plate member and the base member. A column extends from a first surface of the base member. The stem is pivotally received in an opening of the column. A retaining block has an
10 opening for receiving the column.
